# Functional Data Analysis

# FDA framework and examples

**Observations** of a random variable  $X$  taking values in a **space of functions**  $\mathcal{X}$  (typically, an infinite dimensional Hilbert space as  $L^2$ ):

$X_1, \dots, X_n$ .

The function is **observed** at  $t_{i1}, \dots, t_{id_i}$ .

**Applications** in: time series analysis, speech recognition, biochemistry (NIR spectra for instance), metabolomic data (NMR), weather data...

# Typical issues in FDA

- 1 variance operator used in standard model **does not have a continuous inverse**:  $\Gamma_X = \mathbb{E}(X \otimes X) - \mathbb{E}(X) \otimes \mathbb{E}(X)$  is a Hilbert Schmidt operator  $\Rightarrow \Gamma_X^{-1}$  is not bounded.

As a consequence,  $\Gamma_X^n = \frac{1}{n} \sum_i x_i \otimes x_i - \bar{x} \otimes \bar{x}$  is **ill-conditionned** (and its inverse a bad estimate of  $\Gamma_X^{-1}$ ).

$\Rightarrow$  **regularization or penalization** techniques are needed.

# Typical issues in FDA

- ① variance operator used in standard model **does not have a continuous inverse**:  $\Gamma_X = \mathbb{E}(X \otimes X) - \mathbb{E}(X) \otimes \mathbb{E}(X)$  is a Hilbert Schmidt operator  $\Rightarrow \Gamma_X^{-1}$  is not bounded.

As a consequence,  $\Gamma_X^n = \frac{1}{n} \sum_i x_i \otimes x_i - \bar{x} \otimes \bar{x}$  is **ill-conditioned (and its inverse a bad estimate of  $\Gamma_X^{-1}$ )**.

$\Rightarrow$  **regularization or penalization** techniques are needed.

- ②  $(x_i)_i$  are **never perfectly observed** and only a digitized (sometimes noisy) estimation is available.

$\Rightarrow$  **reconstruction** techniques are needed to provide a functional representation of the data, remove noise and measurement artefacts (translation, scaling, . . . , of the functions).

# Overview of my contributions

## Supervised learning framework

$(X, Y)$  st  $X \in \mathcal{X}$ ,  $Y \in \mathbb{R}$  (regression) or  $Y \in \{-1, 1\}$  (binary classification).

Observations:  $(x_i, y_i)_{i=1, \dots, n}$

**Purpose:** estimate  $\hat{y}$  for a new  $x$ .  $(x_i, y_i)_i$  is used to define a prediction function  $\Phi^n$ .

# Overview of my contributions

## Supervised learning framework

$(X, Y)$  st  $X \in \mathcal{X}$ ,  $Y \in \mathbb{R}$  (regression) or  $Y \in \{-1, 1\}$  (binary classification).

Observations:  $(x_i, y_i)_{i=1, \dots, n}$

**Purpose:** estimate  $\hat{y}$  for a new  $x$ .  $(x_i, y_i)_i$  is used to define a prediction function  $\Phi^n$ .

- **Inverse methods** use  $\mathcal{L}(X|Y)$  to estimate  $\mathcal{L}(Y|X)$ 
  - ▶ [2] (Ferré & Villa, *Scandinavian Journal of Statistics*, 2006) in the **FIR** (Functional Inverse Regression) model

$$Y = F(\langle X, \beta_1 \rangle, \dots, \langle X, \beta_d \rangle, \epsilon),$$

with  $F$  and  $(\beta_j)_j$  to be estimated, smooth estimation of the  $(\beta_j)_j$  combined with the estimation of  $F$  by multi-layer perceptron.

# Overview of my contributions

## Supervised learning framework

$(X, Y)$  st  $X \in \mathcal{X}$ ,  $Y \in \mathbb{R}$  (regression) or  $Y \in \{-1, 1\}$  (binary classification).

# Kernels for functional data

Given  $K : \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$  st

- **symmetry**:  $K(x, x') = K(x', x)$
- **positivity**:  $\forall N \in \mathbb{N}, \forall (\alpha_i) \subset \mathbb{R}^N, \forall (x_i) \subset \mathcal{X}^N, \sum_{i,j} \alpha_i \alpha_j K(x_i, x_j) \geq 0$ .

$\exists!$   $(\mathcal{H}, \langle \cdot, \cdot \rangle_{\mathcal{H}})$  (RKHS) and  $\Psi : \mathcal{X} \rightarrow \mathcal{H}$  st  $K(x, x') = \langle \Psi(x), \Psi(x') \rangle_{\mathcal{H}}$

## General form for FD

pre-processing:  $\mathcal{P} : \mathcal{X} \rightarrow \mathcal{D}$

$$\forall x, x' \in \mathcal{X}, Q(x, x') = K(\mathcal{P}(x), \mathcal{P}(x')).$$

- 1 **projections**: for  $V_d = \text{Vect} \{\psi_1, \dots, \psi_d\}$ ,  $\mathcal{P}(x) = \sum_{j=1}^d \langle x, \psi_j \rangle \psi_j$  (and  $K = K_d$ , standard kernel on  $\mathbb{R}^d$ ).
- 2 **functional transformation**:  $\mathcal{P}(x) = D^q x, \dots$
- 3 **FIR...**

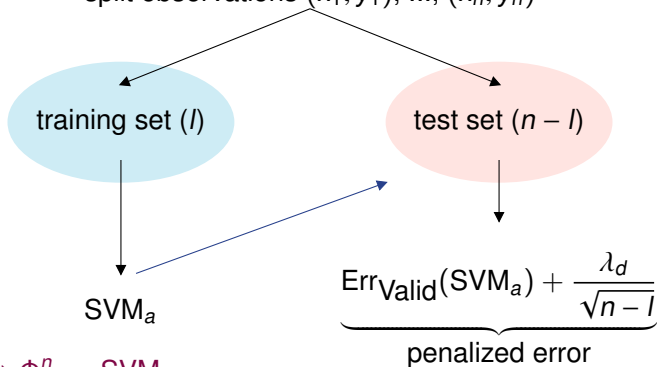

# A consistent approach

[6] (Rossi & Villa, *Neurocomputing*, 2006)

SVM for functional data:  $(X, Y) \in \mathcal{X} \times \{-1, 1\}$  with kernel  $Q = K_d \circ \mathcal{P}_{V_d}$ ,  $K_d$  standard kernel on  $\mathbb{R}^d$

selection of  $a = (d, K_d, C) \in \mathbb{N} \times \mathcal{I}_d \times [0, C_d]$ :

split observations  $(x_1, y_1), \dots, (x_n, y_n)$

$\Rightarrow \Phi^n := \text{SVM}_{a^*}$

# Assumptions

[6] (Rossi & Villa, *Neurocomputing*, 2006)

## Assumptions on the law of $X$

**(A1)**  $X$  takes its values in a bounded subspace of  $\mathcal{X}$ .

## Assumptions on the parameters: $\forall d \geq 1$ ,

**(A2)**  $\mathcal{J}_d$  is a finite set;

**(A3)**  $\exists K_d \in \mathcal{J}_d$  (kernels on  $\mathbb{R}^d$ ) st:  $K_d$  is **universal** and

$\exists \nu_d > 0 : \mathcal{N}(K_d, \epsilon) = \mathcal{O}(\epsilon^{-\nu_d})$ ;

**(A4)**  $C_d > 1$  ;

**(A5)**  $\sum_{d \geq 1} |\mathcal{J}_d| e^{-2\lambda_d^2} < +\infty$ .

## Assumptions on the training/validation sets

**(A6)**  $\lim_{n \rightarrow +\infty} l = +\infty$  ;

**(A7)**  $\lim_{n \rightarrow +\infty} n - l = +\infty$  ;

**(A8)**  $\lim_{n \rightarrow +\infty} \frac{l \log(n-l)}{n-l} = 0$ .

# Convergence to the Bayes error

[6] (Rossi & Villa, *Neurocomputing*, 2006)

## Theorem: universal consistency

Under the assumptions **(A1)**-**(A8)**,

$$L\Phi^n \xrightarrow{n \rightarrow +\infty} L^*,$$

where

- $L\Phi^n = \mathbb{P}(\Phi^n(X) \neq Y)$
- $L^* = \mathbb{P}(\Phi^*(X) \neq Y)$  with  $\Phi^*(x) = \begin{cases} 1 & \text{if } \mathbb{P}(Y = 1|X = x) > 1/2, \\ -1 & \text{otherwise.} \end{cases}$

# Convergence to the Bayes error

[6] (Rossi & Villa, *Neurocomputing*, 2006)

## Theorem: universal consistency

Under the assumptions **(A1)**-**(A8)**,

$$L\Phi^n \xrightarrow{n \rightarrow +\infty} L^*,$$

where

- $L\Phi^n = \mathbb{P}(\Phi^n(X) \neq Y)$
- $L^* = \mathbb{P}(\Phi^*(X) \neq Y)$  with  $\Phi^*(x) = \begin{cases} 1 & \text{if } \mathbb{P}(Y = 1|X = x) > 1/2, \\ -1 & \text{otherwise.} \end{cases}$

[8] (Rossi & Villa-Vialaneix, *Pattern Recognition Letter*, 2011) alternative kernel for:

- digitized observations
- derivation preprocessing

with a general consistency result in regression and binary classification.

- Individual
- Transaction

# Graph mining

# Framework of this section

A graph (network)  $\mathcal{G} = (V, E, W)$  with

- $n$  vertices  $V = \{x_1, \dots, x_n\}$  ;
- a set of edges,  $E$ , weighted by  $W_{ij} = W_{ji} \geq 0$  ( $W_{ii} = 0$ ).

# Visualization: a tool for graph mining

Standard approach for graph visualization: **force directed placement algorithms** (FDP). **Drawbacks:**

- **slow** (impracticable for large graphs);
- based on **aesthetic** criteria rather than on interpretability:
  - ▶ *trend*: short and uniform length edges;
  - ▶ *negative consequence*: nodes with the largest degrees are grouped in the middle of the layout.

# Visualization: a tool for graph mining

Standard approach for graph visualization: **force directed placement algorithms** (FDP). **Drawbacks:**

- **slow** (impracticable for large graphs);
- based on **aesthetic** criteria rather than on interpretability:
  - ▶ *trend*: short and uniform length edges;
  - ▶ *negative consequence*: nodes with the largest degrees are grouped in the middle of the layout.

A **more natural way to explore a graph:**

- 1 highlight the **macroscopic structure**: find “communities” and relations between them;
- 2 eventually **focus on finer details** in some communities.

# Overview of my contributions

- **topographic maps**: combine clustering and visualization using a prior structure (*ie* a map):
  - ▶ **batch kernel SOM** [1] (Boulet, *et al.*, *Neurocomputing*, 2008) and **on-line multiple relational SOM** [4] (Olteanu & Villa-Vialaneix, *Neurocomputing*, 2015) (not restricted to graphs; can handle multiple graphs or labeled graphs)

# Using topographic maps to visualize a clustered graph

- vertices are clustered in  $U$  units
- units are arranged on a prior 2D-grid equipped with a topology
- **prior positions** of the units are used to produce a simplified representation

# How to extend topographic maps to graph?

## Generic approach using kernel/dissimilarity

[4] (Olteanu & Villa-Vialaneix, *Neurocomputing*, 2015), [1] (Boulet, *et al.*, *Neurocomputing*, 2008) graphs can be described by pairwise relations between nodes:

- with a kernel (ex:  $K^\beta = e^{-\beta L}$ , with  $L$  the graph Laplacian, **heat kernel**)
- with a dissimilarity (ex: shortest path length)

⇒ extension of SOM to kernel/dissimilarity data using prototypes of the form  $p_u = \sum_{i=1}^n \gamma_{ui} x_i$ .

# How to extend topographic maps to graph?

## Generic approach using kernel/dissimilarity

[4] (Olteanu & Villa-Vialaneix, *Neurocomputing*, 2015), [1] (Boulet, *et al.*, *Neurocomputing*, 2008) graphs can be described by pairwise relations between nodes:

- with a kernel (ex:  $K^\beta = e^{-\beta L}$ , with  $L$  the graph Laplacian, **heat kernel**)
- with a dissimilarity (ex: shortest path length)

⇒ extension of SOM to kernel/dissimilarity data using prototypes of the form  $p_u = \sum_{i=1}^n \gamma_{ui} x_i$ .

## Graph specific approach

[7] (Rossi & Villa-Vialaneix, *Neurocomputing*, 2010) Extension of the **modularity** quality criterion to a criterion **taking into account the prior topology**

$$O = \frac{1}{2m} \sum_{ijk} M_{ik} S_{kl} M_{jk} B_{ij}$$

$B = \left( W_{ij} - \frac{d_i d_j}{2m} \right)$  modularity matrix ( $d_i = \sum_j W_{ij}$  and  $m = \frac{\sum_i d_i}{2}$ );  $M_{ik} = \mathbf{1}_{x_i \in k}$ ;  $S$  encodes the topology of the prior map (similarity)

# Practical aspects of kernel/relational SOM

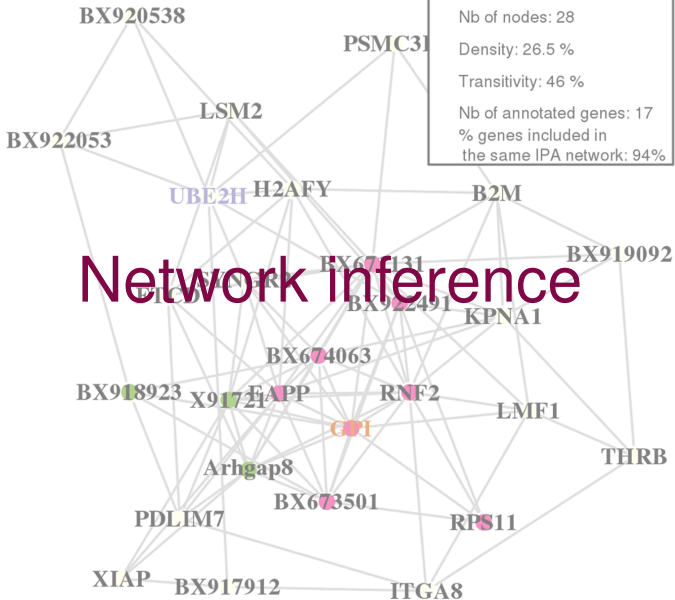

- this approach (and others) is implemented in the R package **SOMbrero** provided with a WUI based on **shiny**;
- it can also handle data described by **multiple dissimilarities**: the combination is optimized by including a **gradient descent-like step** in the relational SOM algorithm;

# Practical aspects of kernel/relational SOM

- this approach (and others) is implemented in the R package **SOMbrero** provided with a WUI based on **shiny**;
- it can also handle data described by **multiple dissimilarities**: the combination is optimized by including a **gradient descent-like step** in the relational SOM algorithm;
- it has been applied to graphs, labeled graphs and to other non vectorial data (school-to-work trajectories)

# Network inference

**Data:** large scale gene expression data

$$\begin{array}{l} \text{individuals} \\ n \approx 30/50 \end{array} \quad \underbrace{\left\{ X = \begin{pmatrix} \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & X_i^j & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \end{pmatrix} \right\}}_{\text{variables (genes expression), } p \approx 10^4}$$

**What we want to obtain:** a graph/network with

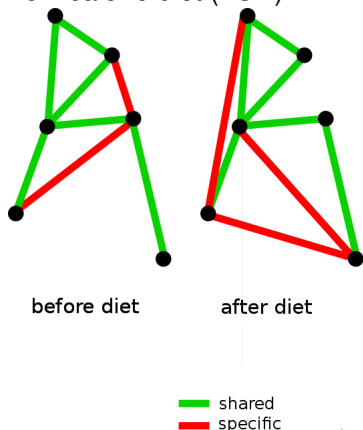

- nodes: (selected) genes;
- edges: strong links between gene expressions.

# Overview of my contributions

- **application of network inference** for understanding the determinant of human adipose tissue gene expression [11] (Viguerie, *et al.*, *PLoS Genetics*, 2012)
- **network inference with multiple samples** [14] (Villa-Vialaneix, *et al.*, *Quality Technology and Quantitative Management*, 2014)

# Motivation for multiple networks inference

Pan-European project Diogenes<sup>1</sup> (with Nathalie Viguerie, INSERM): gene expressions (lipid tissues) from 204 obese women **before** and **after** a low-calorie diet (LCD).

- **Assumption:** A common functioning exists regardless the condition;
- Which genes are linked **independently from/depending on** the condition?

<sup>1</sup><http://www.diogenes-eu.org>

# Consensus LASSO

## GGM with $L^1$ penalty: one condition

$(X_i)_{i=1,\dots,n}$  are i.i.d. Gaussian random variables  $\mathcal{N}(0, \Sigma)$

$$X^j = \beta_j^T X^{-j} + \epsilon \quad ; \quad \arg \min_{(\beta_{jj'})_{j'}} \sum_{i=1}^n (X_{ij} - \beta_j^T X_i^{-j})^2 + \lambda \|\beta_j\|_{L^1}$$

$j \longleftrightarrow j'$  (genes  $j$  and  $j'$  are linked)  $\Leftrightarrow \beta_{jj'} \neq 0$

## Consensus LASSO: multiple conditions

$$\frac{1}{2} \beta_j^T \widehat{\Sigma}_{\cup\cup} \beta_j + \beta_j^T \widehat{\Sigma}_{\cup} + \lambda \|\beta_j\|_{L^1} + \mu \sum_c w_c \|\beta_j^c - \beta_j^{\text{cons}}\|_{L^2}^2$$

with  $\widehat{\Sigma}_{\cup\cup}$ : block diagonal matrix  $\text{Diag}(\widehat{\Sigma}_{\cup\cup}^1, \dots, \widehat{\Sigma}_{\cup\cup}^k)$  and similarly for  $\widehat{\Sigma}_{\cup}$ :

- $w_c$ : real number used to weight the conditions;
- $\mu$  regularization parameter;
- $\beta_j^{\text{cons}}$  whatever you want...?

# Choice of a consensus

## Case 1: a priori consensus

Using a fixed  $\beta_j^{\text{cons}}$ , the optimization problem is equivalent to minimizing the  $p$  following standard quadratic problem in  $\mathbb{R}^{k(p-1)}$  with  $L_1$ -penalty:

$$\frac{1}{2}\beta_j^T B^1(\mu)\beta_j + \beta_j^T B^2(\mu) + \lambda\|\beta_j\|_{L^1},$$

## Case 2: learn the consensus

Using  $\beta_j^{\text{cons}} = \sum_{c=1}^k \frac{n_c}{n} \beta_j^c$ , the optimization problem is equivalent to minimizing the following standard quadratic problem with  $L_1$ -penalty:

$$\frac{1}{2}\beta_j^T S_j(\mu)\beta_j + \beta_j^T \widehat{\Sigma}_{jN} + \lambda\|\beta_j\|_{L^1}$$

**Optimization** by active set, combined with bootstrap approach (BOLASSO type). R package **therese**.

Future work

# Research project: data mining and integration with SOM

## On-going issues

- stabilize results, improve quality, speed-up training: **aggregation**, **boosting**...
- **improve interpretability** in a multi-kernel/dissimilarity context: visualization, prototype sparsity...
- **targeted applications**: multi-'omics integration and exploration; ncRNA typology

## Collaborations

- methodological aspects: Jérôme Mariette (PhD, MIAT, INRA), Madalina Olteanu (SAMM, Université Paris 1)
- application to multi-'omics data: Nathalie Viguerie (INSERM, Diogenes project)
- application to ncRNA: Christine Gaspin (MIAT, INRA)

# Research project: data mining and integration using graphical approaches

## On-going issues

- integrating multi-'omics data in network inference and mining, possibly with different numbers of observations
- taking temporal aspects into account in network inference/clustering

## Collaborations

- methodological aspects: Valérie Sautron (PhD, GenPhySE, INRA)
- applications: projects SusOSstress & PigHeat (GenPhySE, INRA) on systems genetics in pigs (stress & heat resistance)
- application: Nathalie Viguerie (INSERM, Diogenes project) & Ignacio Gonzáles (MIAT, INRA)... *submitted article*
